

Maintenance instructions for painted metal parts

The original surface treatment used for the metal parts is polyester powder paint.

Description of maintenance paint: Surface treatment for metal. Car paints can be used as an alternative surface treatment.

Treatment:

1. Sand down the area to be painted with G240-320 sandpaper or sanding mat.
2. Clean the surface of any dust and oil.
3. Protect the parts that will not be painted.
4. Use a brush to paint smaller areas. For larger areas, you may use a paint spray, in which case remember to dilute the paint with water.
5. Allow to dry, the drying time is shown on the container.

Please note: Maintenance paints for metal parts are intended to be used as touch-up paint for scratches and minor defects in surface. Paints are not intended for overspraying of large areas.
